

Your strategy, before the evidence

PART A / Complete before the class reveal

Name: _____ Class: _____ Date: _____

You have 100 advertisement units. Allocate nonnegative whole numbers across five zones. More ads wins the full zone value; ties split it. Your fixed allocation faces every participating classmate once. Each match distributes 15 points.

Zone	1. Industrial	2. Transit	3. Commercial	4. Innovation	5. Skyline
Value	1	2	3	4	5
My ads					
Predicted avg.					

Both rows must total 100. Predict the class average in zone order; label any rounding.

1. Why did you choose this allocation?

Explain the trade-offs between zone values and the competition you expected.

2. Which zone will be most contested, and why?

Define what you mean by contested. What assumptions are you making about classmates?

3. What is the biggest weakness in your strategy?

Describe an opponent allocation or pattern of class choices that could exploit it.

What did the class field reveal?

PART B / Complete after reveal and the tournament

Name: _____ Participants: ____ Rank: ____ / ____

My total: _____ Matches: ____ Average: _____ Wins / ties / losses: ____ / ____ / ____

Class averages, zones 1-5: _____ / _____ / _____ / _____ / _____

4. Which zones were overvalued?

Compare ads attracted, zone values and points earned. High spending alone is not proof.

5. Which zones were easier to win than expected?

Use your original prediction and at least one actual matchup as evidence.

6. Did the class overinvest in Skyline Core?

Use the class average and two matchup examples. Consider the opportunity cost.

7. Which strategies were strongest against this class?

Compare a strong strategy with a weaker one. Explain why the actual field mattered.

A better response is a testable claim

PART C / Apply game theory, then submit all three pages

Name: _____

Propose a revised allocation after seeing the field. Hold every other student's submitted allocation fixed; exclude your own original entry when evaluating the revision.

Revised ads, zones 1-5: _____ / _____ / _____ / _____ / _____ **Total: 100**

8. Test your revision against two different classmates.

Write their allocations and calculate both match scores. Explain each zone win or tie. For example, equal ads in zone 5 give 2.5 points each.

9. Is the tournament winner using a dominant strategy?

Explain the difference between winning against this class, a best response to fixed opponents, and a strategy that works at least as well against every possible opponent strategy.

10. What did individual competition leave out?

This experiment models individual competition. How might cooperation, group incentives or wider economic systems change the decisions or outcomes?

Submission check: Include detailed explanations, your original and revised allocations, predictions, class averages, and two worked matchups. Academic credit is for reasoning and evidence, not leaderboard position.
